## **CLAIM AMENDMENTS**

1. (Original) A method for matching voice characteristics of a disc jockey, said method comprising: receiving, by a sound characteristic estimator, a first segment of audio signal; determining, by said sound characteristic estimator, a first set of sound characteristics from said first segment of audio signal; receiving, by said sound characteristic estimator, a second segment of audio signal; determining, by said sound characteristic estimator, a second set of sound characteristics from said second segment of audio signal; and interpolating a voice characteristic transition for said disc jockey from said first set of sound characteristics to said second set of sound characteristics between a starting time and an ending time.

- 2. (Original) The method according to claim 1, wherein said first segment of audio signal includes an audio signal of a song.
- 3. (Original) The method according to claim 1, wherein said first segment of audio signal includes an audio signal of a sports program.
- 4. (Original) The method according to claim 1, wherein said sound characteristics include pitch.
- 5. (Original) The method according to claim 1, wherein said sound characteristics include tempo.
- 6. (Original) The method according to claim 1, wherein said sound characteristics include volume.
- 7. (Original) The method according to claim 1, wherein said interpolating comprises:

converting said first set and said second set of sound characteristics of said segments of audio signals to a corresponding first set of voice characteristics and second set of voice characteristics of said disc jockey; and generating an interpolation between said first set of voice characteristics and said second set of voice characteristics of said disc jockey to produce said voice characteristics transition.

- 8. (Original) The method according to claim 7, wherein said generating an interpolation includes generating said interpolation using a linear method.
- 9. (Original) The method according to claim 7, wherein said generating an interpolation includes generating a voice transition between a voice characteristic from said first set of voice characteristics and a corresponding voice characteristic from said second set of voice characteristics.
- 10. (Original) The method according to claim 7, wherein said voice characteristics include average pitch.
- 11. (Original) The method according to claim 7, wherein said voice characteristics include speaking rate.
- 12. (Original) The method according to claim 7, wherein said voice characteristics include loudness.
- 13. (Original) The method according to claim 7, wherein said voice characteristics include prosody.
- 14. (Original) The method according to claim 1, further comprising: receiving, by a synthetic disc jockey, a piece of text, said voice characteristic transition, said starting time, and said ending time; and

generating, by said synthetic disc jockey using a text-to-speech engine, a speech signal with a duration from said starting time to said ending time based on said piece of text and said voice characteristic transition.

- 15. (Original) The method according to claim 14, further comprising choosing a sample set of voice characteristics for said synthetic disc jockey based on a genre of said first segment of audio signal.
- 16. (Original) The method according to claim 14, wherein said piece of text represents announcement information of a disc jockey.
- 17. (Original) The method according to claim 14, further comprising rendering said speech signal to generate an announcement of said synthetic disc jockey.
- 18. (Original) A computer-readable medium encoded with a plurality of processor-executable instruction sequences for:

receiving, by a sound characteristic estimator, a first segment of audio signal; determining, by said sound characteristic estimator, a first set of sound characteristics from said first segment of audio signal;

receiving, by said sound characteristic estimator, a second segment of audio signal; determining, by said sound characteristic estimator, a second set of sound characteristics from said second segment of audio signal; and

interpolating a voice characteristic transition for said disc jockey from said first set of sound characteristics to said second set of sound characteristics between a starting time and an ending time.

- 19. (Original) The computer-readable medium according to claim 18, wherein said first segment of audio signal includes an audio signal of a news program.
- 20. (Original) The computer-readable medium according to claim 18, wherein said sound characteristics include tempo.

21. (Original) The computer-readable medium according to claim 18, wherein said interpolating comprises: converting said first set and said second set of sound characteristics of said segments of audio signals to a corresponding first set of voice characteristics and second set of voice characteristics of said disc jockey; and generating an interpolation between said first set of voice characteristics and said second set of voice characteristics of said disc jockey to produce said voice characteristics transition.

- 22. (Original) The computer-readable medium according to claim 21, wherein said generating an interpolation includes generating said interpolation using a linear method.
- 23. (Original) The computer-readable medium according to claim 21, wherein said generating an interpolation includes generating a voice transition between a voice characteristic from said first set of voice characteristics and a voice characteristic from said second set of voice characteristics.
- 24. (Original) The computer-readable medium according to claim 21, wherein said voice characteristics include dynamic range of pitch.
- 25. (Original) The computer-readable medium according to claim 18, said computer-readable medium being further encoded with processor-executable instruction sequences for:

receiving, by a synthetic disc jockey, a piece of text, said voice characteristic transition, said starting time, and said ending time; and

generating, by said synthetic disc jockey using a text-to-speech engine, a speech signal with a duration from said starting time to said ending time based on said piece of text and said voice characteristic transition.

26. (Original) A system for matching voice characteristics of a disc jockey, said system comprising:

a sound characteristic estimator, said estimator being configured to receive a first and a second segment of audio signal, and to respectively determine a first and a second set of sound characteristics from said first and second segments of audio signal; and an interpolator, said interpolator being configured to interpolate a voice characteristic transition for said disc jockey from said first set of sound characteristics to said second set of sound characteristics between a starting time and an ending time.

- 27. (Original) The system according to claim 26, wherein said sound characteristics include pitch.
- 28. (Original) The system according to claim 26, wherein said interpolator is configured to:

convert said first set and said second set of sound characteristics of said segments of audio signals to a corresponding first set of voice characteristics and second set of voice characteristics of said disc jockey; and

generate an interpolation between said first set of voice characteristics and said second set of voice characteristics of said disc jockey to produce said voice characteristics transition.

- 29. (Original) The system according to claim 28, wherein said interpolator generates an interpolation using a linear method.
- 30. (Original) The system according to claim 26, further comprising: a synthetic disc jockey, said synthetic disc jockey being configured to receive a piece of text and said voice characteristic transition; and a text-to-speech engine,

wherein said synthetic disc jockey is configured to generate, using said text-to-speech engine, a speech signal with a duration from said starting time to said ending time based on said piece of text and said voice characteristic transition.
